

## Continuity of intersection of analytic sets

by P. TWORZEWSKI and T. WINIARSKI (Kraków)

*Dedicated to the memory of Jacek Szarski*

**Abstract.** Let  $k$  be a positive integer and let  $V_1, \dots, V_k$  be purely  $k$ -dimensional analytic subsets of an open set  $\Omega \subset \mathbb{C}^n$ . In this paper we present certain theorems on the continuity of the mapping

$$\cap: (V_1, \dots, V_k) \rightarrow V_1 \cap \dots \cap V_k.$$

As simple consequences we obtain the Hurwitz theorem and the theorem on injectivity of the limit of a sequence of injective holomorphic mappings  $f_\nu: \Omega \rightarrow \mathbb{C}^n$ .

**1. Topology of local uniform convergence.** Let  $X$  be a metric space. Let  $\mathcal{F}_X$  be the family of all closed subsets of  $X$ . We endow  $\mathcal{F}_X$  with the topology  $\mathcal{T}_X$  generated by the sets

$$\mathcal{U}(S, K) = \{F \in \mathcal{F}_X: F \cap K = \emptyset, F \cap U \neq \emptyset \text{ for } U \in S\}$$

corresponding to all compact subsets  $K \subset X$  and all finite families  $S$  of open subsets of  $X$ . We call this topology the *topology of local uniform convergence*.

A simple argument shows that if  $X, Y$  are metric spaces, then  $f: X \rightarrow Y$  is a homeomorphism if and only if the mapping  $\mathcal{F}_X \ni F \rightarrow f(F) \in \mathcal{F}_Y$  is a homeomorphism.

Now,  $F_\nu \rightarrow F$  will denote that  $F$  is the limit of the sequence  $\{F_\nu\}$  in the above topology. An immediate consequence of the definition is

LEMMA 1. *If  $F, F_\nu \in \mathcal{F}_X$ ,  $\nu = 1, 2, \dots$ , then the following statements are equivalent:*

- (1)  $F_\nu \rightarrow F$ ;
- (2) *for every  $x \in F$  there exists a sequence  $x_\nu \in F_\nu$ ,  $\nu = 1, 2, \dots$ , such that  $x_\nu \rightarrow x$  (in the topology of  $X$ ) and for every compact subset  $K \subset X \setminus F$ ,  $F_\nu \cap K \neq \emptyset$  for at most finitely many indices  $\nu$ ;*
- (3) *for every  $x \in F$  there exists a sequence  $x_\nu \in F_\nu$ ,  $\nu = 1, 2, \dots$ , such that  $x_\nu \rightarrow x$ , and for every  $x \notin F$  there exists a neighbourhood  $U$  of  $x$  such that  $F_\nu \cap U \neq \emptyset$  for at most finitely many indices  $\nu$ ;*

( $\pm$ ) for every  $x \in F$ , and for every neighbourhood  $V$  of  $x$ ,  $F_v \cap V = \emptyset$  for at most finitely many integers  $v$ , and for every  $x \notin F$  there exists a neighbourhood  $U$  of  $x$  such that  $F_v \cap U \neq \emptyset$  for at most finitely many indices  $v$ .

**COROLLARY 1.** *Let  $X, Y$  be two metric spaces and suppose that mappings  $f, f_v: X \rightarrow Y, v = 1, 2, \dots$ , are continuous. If the sequence  $\{f_v\}$  converges uniformly to  $f$  on compact subsets of  $X$ , then  $f_v \rightarrow f$  in the topology  $\mathcal{T}_{X \times Y}$ .*

If  $X$  is a compact metric space, then the topology  $\mathcal{T}_X$  can be introduced by the classical Hausdorff metric in  $\mathcal{F}_X$  defined by

$$\text{dist}(A, B) = \begin{cases} 0 & \text{for } A = B = \emptyset, \\ \max\{\max_{x \in A} \text{dist}(x, B), \max_{x \in B} \text{dist}(x, A)\} & \text{for } A \neq \emptyset, B \neq \emptyset, \\ \text{diam } X + 1 & \text{in other cases.} \end{cases}$$

In this case  $\mathcal{F}_X$  is a metrizable compact space (cf. [3], p. 58).

In general, we have

**LEMMA 2.** *Let  $X$  be a locally compact, second-countable metric space. Then  $\mathcal{F}_X$  is a metrizable compact space.*

*Proof.* Let  $Y$  be a compact metric space and  $h: X \rightarrow Y$  be a mapping such that  $h(X)$  is an open subset of  $Y$  and  $h: X \rightarrow h(X)$  is a homeomorphism. (For example we can take as  $Y$  a one-point compactification of  $X$  and for  $h$  the identical embedding.) It is easy to see that the mapping

$$p: \mathcal{F}_Y \ni F \rightarrow h^{-1}(F \cap h(X)) \in \mathcal{F}_X \quad \text{is continuous}$$

and that the set  $\mathcal{K} = \{F \in \mathcal{F}_Y: F \supset (Y \setminus h(X))\} \subset \mathcal{F}_Y$  is compact. The restriction  $\text{resp}: \mathcal{K} \rightarrow \mathcal{F}_X$  is a continuous bijection defined on a compact space onto the Hausdorff space  $\mathcal{F}_X$ . Hence  $\mathcal{K}$  and  $\mathcal{F}_X$  are homeomorphic. This concludes the proof of Lemma 2.

**2. Continuity of intersection.** Let  $\Omega$  be an open subset of  $C^n$  and let  $\mathcal{T}_\Omega$  be the topology in  $\mathcal{F}_\Omega$  described in Section 1, for  $X = \Omega$ . By  $\mathcal{A}_p(\Omega)$  we will denote the subset of  $\mathcal{F}_\Omega$  consisting of all purely  $p$ -dimensional analytic subsets of  $\Omega$ . We will suppose that  $\emptyset \in \mathcal{A}_p(\Omega)$  for  $p = 0, 1, \dots, n$ .

**PROPOSITION 1.** *Suppose that  $L$  is an affine  $(n - k)$ -dimensional subspace of  $C^n, 0 \leq k \leq n, F \in \mathcal{F}_\Omega, z_0$  is an isolated point of  $F \cap L$ . Let  $U$  be an open neighbourhood of  $z_0$  such that  $\bar{U} \subset \Omega, \bar{U}$  is compact,  $\bar{U} \cap L \cap F = \{z_0\}$ . Then there exists a neighbourhood  $\mathcal{U}_F \in \mathcal{T}_\Omega$  of  $F$  such that*

$$1 \leq \#(L \cap U \cap V) < \infty$$

for every purely  $k$ -dimensional analytic subset  $V$  of  $\Omega$  belonging to  $\mathcal{U}_F$ .

*Proof.* If  $k = 0$ , then  $L = C^n$  and it suffices to take  $\mathcal{U}_F = \mathcal{U}(\{U\}, \partial U)$ .

If  $k = n$ , then  $L = \{z_0\}, \mathcal{U}_F = \mathcal{U}(\{\Omega_0\}, \emptyset)$ , where  $\Omega_0$  is the component of  $\Omega$  such that  $z_0 \in \Omega_0$ .

Let us fix  $0 < k < n$  and assume that  $z_0 = 0$ . Let  $X$  be a  $k$ -dimensional vector subspace of  $C^n$  such that  $C^n = X + L$ . Obviously, there exist two open connected neighbourhoods  $U_X, U_L$  of 0 in  $X$  and  $L$ , respectively, such that  $(\bar{U}_X + \partial U_L) \cap F = \emptyset, U_L \cap F = \{0\}, \overline{U_X + U_L} \subset U$ . Let us define

$$\mathcal{U}_F^1 := \mathcal{U}(\{U_X + U_L\}, \bar{U}_X + \partial U_L),$$

and let  $p$  be the restriction of the projection  $X + L \ni x + y \rightarrow x \in X$  to the set  $U_X + U_L$  and let  $V$  be a purely  $k$ -dimensional analytic subset of  $\Omega$ . If  $V \in \mathcal{U}_F^1$ , then  $p|_V: V \rightarrow U_X$  is proper. Since  $V \cap (U_X + U_L)$  is a purely  $k$ -dimensional analytic subset and  $p|_V$  is a proper mapping to an open, connected subset of  $C^k$ , it follows that

$$p|_V: V \rightarrow U_X$$

is a finite-sheeted branched covering of  $U_X$  (cf. Chapter III, Section B of [1], especially Theorem 21). Hence

$$1 \leq \#(p|_V)^{-1}(0) = \#(L \cap U_L \cap V) \leq \#(L \cap U \cap V).$$

Since  $(F \cap \partial U) \cap L = \emptyset, F \cap \partial U$  is compact and  $L$  is closed, there exists an open set  $G \supset F \cap \partial U$  such that  $G \cap L = \emptyset$ . Let us write

$$\mathcal{U}_F^2 = \mathcal{U}(\{\emptyset\}, (\partial U \setminus G))$$

and let  $V$  be a purely  $k$ -dimensional analytic subset of  $\Omega$ . If  $V \in \mathcal{U}_F^2$ , then  $L \cap \bar{U} \cap V = L \cap U \cap V$ . Hence  $L \cap U \cap V$  is a compact analytic subset of  $U$ . Then it must be a finite subset of  $U$ . Therefore, it suffices to take  $\mathcal{U}_F = \mathcal{U}_F^1 \cap \mathcal{U}_F^2$ .

Now, keeping  $\Omega$  as before, we shall prove the following

**THEOREM 1.** *Let us suppose that*

(1)  $F_1, \dots, F_k$  are closed subsets of  $\Omega$  and  $z_0$  is an isolated point of  $F_1 \cap \dots \cap F_k$ ;

(2)  $U$  is an open neighbourhood of  $z_0$  such that  $\bar{U} \subset \Omega, \bar{U}$  is compact and  $\bar{U} \cap (F_1 \cap \dots \cap F_k) = \{z_0\}$ .

Then there exist neighbourhoods  $\mathcal{U}_{F_1}, \dots, \mathcal{U}_{F_k}$  (in topology  $\mathcal{F}_\Omega$ ) of the sets  $F_1, \dots, F_k$ , respectively, such that the condition  $V_j \in \mathcal{A}_{d_j}(\Omega) \cap \mathcal{U}_{F_j}, j = 1, \dots, k$ , and  $\sum_{j=1}^k d_j = (k-1)n$  implies

$$1 \leq \#(V_1 \cap \dots \cap V_k \cap U) < \infty.$$

**Proof.** Straightforward computation with use of Lemma 1 (3) yields that the mapping

$$P: \mathcal{F}_\Omega \times \dots \times \mathcal{F}_\Omega \ni (X_1, \dots, X_k) \rightarrow X_1 \times \dots \times X_k \in \mathcal{F}_{\Omega \times \dots \times \Omega}$$

is continuous.

If we set  $\Delta_k = \{(z, \dots, z) \in (C^n)^k\}$ , then  $z \in X_1 \cap \dots \cap X_k \Leftrightarrow (z, \dots, z) \in (X_1 \times \dots \times X_k) \cap \Delta_k$ . Since the mapping

$$\delta_k: C^n \ni z \rightarrow (z, \dots, z) \in \Delta_k$$

is a homeomorphism, the point  $(z_0, \dots, z_0)$  is an isolated point of  $(F_1 \times \dots \times F_k) \cap \Delta_k = F \cap \Delta_k$ . Let  $U_k$  be an open neighbourhood of  $(z_0, \dots, z_0)$  in  $\Omega^k$  such that

- 1°  $\bar{U}_k \subset \Omega \times \dots \times \Omega$ ;
- 2°  $\bar{U}_k$  is compact;
- 3°  $\bar{U}_k \cap \Delta_k = \overline{\delta_k(U)}$  and  $U_k \cap \Delta_k = \delta_k(U)$ .

Then  $\bar{U}_k \cap \Delta_k \cap F = \overline{\delta_k(U)} \cap F = \delta_k(\bar{U} \cap F_1 \cap \dots \cap F_k) = \delta_k(z_0)$ . It follows from Proposition 1 that there exists a neighbourhood  $\mathcal{U}_F$  of  $F_1 \times \dots \times F_k$  (in the topology  $\mathcal{T}_{\Omega \times \dots \times \Omega}$ ) such that

$$1 \leq \#(V \cap \Delta_k \cap U_k) < \infty$$

for every  $V \in \mathcal{A}_{(k-1)n}(\Omega^k) \cap \mathcal{U}_F$ . Since the mapping  $P$  is continuous, there exist open neighbourhoods  $\mathcal{U}_{F_1}, \dots, \mathcal{U}_{F_k}$  of  $F_1, \dots, F_k$ , respectively, such that

$$P(\mathcal{U}_{F_1} \times \dots \times \mathcal{U}_{F_k}) \subset \mathcal{U}_F.$$

Let us now suppose that  $V_j \in \mathcal{A}_{d_j}(\Omega) \cap \mathcal{U}_{F_j}$  for  $j = 1, \dots, k$  and  $\sum_{j=1}^k d_j = (k-1)n$ . Then  $V = V_1 \times \dots \times V_k$  is a purely  $(k-1)n$ -dimensional analytic subset of  $\Omega^k$  and  $V \in \mathcal{U}_F$ . Hence

$$\begin{aligned} & \#((V_1 \times \dots \times V_k) \cap \Delta_k \cap U_k) \\ &= \#(\delta_k^{-1}((V_1 \times \dots \times V_k) \cap \Delta_k \cap U_k)) = \#(V_1 \cap \dots \cap V_k \cap \delta_k^{-1}(U_k)) \\ &= \#(V_1 \cap \dots \cap V_k \cap U). \end{aligned}$$

Therefore  $1 \leq \#(V_1 \cap \dots \cap V_k \cap U) < \infty$ .

Let  $\Omega$  be an open subset of  $C^n$  and let  $F$  be a closed subset of  $\Omega$ . Let  $z_0 \in F$ . We call  $z_0$  a *t-proper point* of  $F$ ,  $t \in \{0, 1, \dots, n\}$  if there exists an affine  $(n-t)$ -dimensional subspace of  $C^n$  such that  $z_0$  is an isolated point of  $L \cap F$ .

**THEOREM 2.** *Let us suppose that*

- (1)  $F_1, \dots, F_k$  are closed subsets of  $\Omega$ ;
- (2)  $z_0$  is a *t-proper point* of  $\bigcap_{j=1}^k F_j$ , and  $L$  is an affine  $(n-t)$ -dimensional subspace of  $C^n$  such that  $z_0$  is an isolated point of  $F_1 \cap \dots \cap F_k \cap L$ ;
- (3)  $U$  is an open neighbourhood of  $z_0$  such that  $\bar{U} \subset \Omega$ ,  $\bar{U}$  is compact and  $\bar{U} \cap F_1 \cap \dots \cap F_k \cap L = \{z_0\}$ .

Then there exist neighbourhoods  $\mathcal{U}_{F_1}, \dots, \mathcal{U}_{F_k}$  of the sets  $F_1, \dots, F_k$ , respectively, such that if  $V_j \in \mathcal{A}_{d_j}(\Omega) \cap \mathcal{U}_{F_j}$  for  $j = 1, \dots, k$ , then the equality  $t = \sum_{j=1}^k d_j - (k-1)n$  implies that

$$1 \leq \#(V_1 \cap \dots \cap V_k \cap U \cap L) < \infty.$$

**Proof.** Applying Theorem 1 to  $F_1, \dots, F_k, F_{k+1} = L$  and  $V_1, \dots, V_k, V_{k+1} = L$  we get the required result.

Now we state the theorem on the continuity of intersection.

**THEOREM 3.** Let  $V_0 \in \mathcal{A}_p(\Omega)$ ,  $W_0 \in \mathcal{A}_q(\Omega)$  and  $p+q \geq n$ . If  $V_0 \cap W_0 \in \mathcal{A}_{p+q-n}(\Omega)$ , then the mapping

$$\cap: \mathcal{A}_p(\Omega) \times \mathcal{A}_q(\Omega) \ni (V, W) \rightarrow V \cap W \in \mathcal{F}_\Omega$$

is continuous at the point  $(V_0, W_0)$ .

**Proof.** Let  $V_\nu \in \mathcal{A}_p(\Omega)$ ,  $W_\nu \in \mathcal{A}_q(\Omega)$  be two sequences such that  $V_\nu \rightarrow V_0$  and  $W_\nu \rightarrow W_0$ . It has to be proved that  $V_\nu \cap W_\nu \rightarrow V_0 \cap W_0$ .

Let us fix  $x \notin V_0 \cap W_0$ . Then  $x \notin V_0$  or  $x \notin W_0$ . By Lemma 1 (4) there exists an open neighbourhood  $U$  of  $x$  such that  $V_\nu \cap U \neq \emptyset$  or  $W_\nu \cap U \neq \emptyset$  for at most finitely many indices  $\nu$ .

Then  $(V_\nu \cap W_\nu) \cap U \neq \emptyset$  for at most finitely many indices  $\nu$ .

If  $x \in V_0 \cap W_0$ , then it follows from the local analysis of analytic sets (see e.g. [1], [4]) that  $x$  is a  $(p+q-n)$ -proper point of  $V_0 \cap W_0$ . Let  $U$  be an open neighbourhood of  $x$ . It follows from Theorem 2 that there exists  $\nu_0$  such that  $U \cap V_\nu \cap W_\nu \neq \emptyset$  for every  $\nu \geq \nu_0$ .

Therefore by Lemma 1 (4) we get  $V_\nu \cap W_\nu \rightarrow V_0 \cap W_0$ .

As an immediate consequence of Theorem 3 we obtain

**COROLLARY 2.** Let  $W$  be a purely  $q$ -dimensional analytic subset of  $\Omega$ . If  $V_0 \in \mathcal{A}_p(\Omega)$ ,  $p+q \geq n$  and  $V_0 \cap W \in \mathcal{A}_{p+q-n}(\Omega)$ , then the mapping

$$\mathcal{A}_p(\Omega) \ni V \rightarrow V \cap W \in \mathcal{F}_W$$

is continuous at the point  $V_0$ .

**THEOREM 4.** Let  $T$  be a topological space and let  $\Omega$  be an open subset of  $\mathbb{C}^n$ . If  $t_0 \in T$  and

$$g: T \times \Omega \ni (t, z) \rightarrow g(t, z) = g_t(z) \in \mathbb{C}^m \quad (m \leq n)$$

is a continuous mapping such that

(1) for every  $t \in T$ ,  $g_t: \Omega \rightarrow \mathbb{C}^m$  is holomorphic,

(2)  $g_{t_0}^{-1}(0) \in \mathcal{A}_{n-m}(\Omega)$ ,

then the mapping  $T \ni t \rightarrow g_t^{-1}(0) \in \mathcal{F}_\Omega$  is continuous at the point  $t_0$ .

**Proof.** It is easy to see that the mapping  $\varphi: T \ni t \rightarrow g_t \in \mathcal{F}'_{\Omega \times \mathbb{C}^m}$  is continuous.

By Corollary 2 the mapping

$$\psi: \mathcal{A}_n(\Omega \times \mathbb{C}^m) \ni V \rightarrow V \cap (\Omega \times \{0\}) \in \mathcal{F}_{\Omega \times \{0\}} = \mathcal{F}_\Omega$$

is continuous at the point  $g_{t_0}$ . Therefore  $\psi \circ \varphi: T \ni t \rightarrow g_t^{-1}(0) \in \mathcal{F}_\Omega$  is continuous at the point  $t_0$ .

Let us end with three corollaries.

**COROLLARY 3.** *Let  $T$  be a topological space and let  $\Omega$  be an open subset of  $\mathbb{C}^n$ . If  $t_0 \in T$ ,  $a_0 \in \Omega$  and  $g: T \times \Omega \ni (t, z) \rightarrow g_t(z) \in \mathbb{C}^m$  ( $m \leq n$ ) is a continuous mapping such that*

(1) *for every  $t \in T$ ,  $g_t$  is holomorphic in  $\Omega$ ,*

(2)  $g_{t_0}^{-1}(g_{t_0}(a_0)) \in \mathcal{A}_{n-m}(\Omega)$ ,

*then the mapping  $T \times \Omega \ni (t, a) \rightarrow g_t^{-1}(g_t(a))$  is continuous at  $(t_0, a_0)$ .*

**Proof.** To prove this let us define the mapping

$$(T \times \Omega) \times \Omega \ni ((t, a), z) \rightarrow g_t(z) - g_t(a) \in \mathbb{C}^m$$

and observe that all assumptions of Theorem 4 are satisfied.

**COROLLARY 4 (Hurwitz).** *Let  $\Omega$  be an open subset of  $\mathbb{C}^n$ . Suppose that  $f_\nu, f: \Omega \rightarrow \mathbb{C}^m$  ( $m \leq n$ ),  $\nu = 1, 2, \dots$ , are holomorphic mappings. If the sequence  $\{f_\nu\}$  converges to  $f$ , uniformly on compact subsets of  $\Omega$ , and if  $f^{-1}(0) \in \mathcal{A}_{n-m}(\Omega)$ , then  $f_\nu^{-1}(0) \rightarrow f^{-1}(0)$ .*

**Proof.** If we set  $T = \{0\} \cup \bigcup_{\nu=1}^{\infty} \{1/\nu\}$  and

$$g: T \times \Omega \ni (t, z) \rightarrow \begin{cases} f_\nu(z) & \text{for } t = 1/\nu, \\ f(z) & \text{for } t = 0, \end{cases}$$

then we see at once that Corollary 4 is a simple consequence of Theorem 4.

**COROLLARY 5.** *Let  $\Omega$  be a domain in  $\mathbb{C}^n$ . Let  $\{f_\nu\}$  be a sequence of holomorphic injective mappings. Suppose that  $f$  converges uniformly on compact subsets of  $\Omega$  to a holomorphic mapping  $f: \Omega \rightarrow \mathbb{C}^n$ . Then the following three properties are equivalent:*

(1)  *$f$  is injective;*

(2)  *$f$  is open;*

(3)  $\text{Int}f(\Omega) \neq \emptyset$ .

**Proof.** (1)  $\Rightarrow$  (2)  $\Rightarrow$  (3). Obvious.

(3)  $\Rightarrow$  (1). By Sard's theorem, there exists  $z_0 \in \Omega$  such that  $\det f'(z_0) \neq 0$ . Since  $f_\nu$  are injective for  $\nu = 1, 2, \dots$ , then by Osgood's theorem  $\det f'_\nu(z) \neq 0$  for all  $\nu$  and all  $z \in \Omega$ . Hence, using Corollary 4 (see also [2], p. 80), we obtain that  $\det f'(z) \neq 0$  for all  $z \in \Omega$ . Therefore  $f^{-1}(f(a)) \in \mathcal{A}_0(\Omega)$  for all  $a \in \Omega$ . This enables us to use Corollary 4.

Let us suppose that there exist two points  $a, b \in \Omega$ ,  $a \neq b$ , such that  $f(a) = f(b)$ . Applying Corollary 4 to the sequence  $\{f_\nu - f(a)\}$  we get that  $f_\nu$  is not injective for sufficiently large  $\nu$ . This contradicts our assumption.
